

Harvard Forest Data Archive HF069-16

Data File:

Name = hf069is-ems-annual.csv

Description = EMS plots annual summary

Rows = 32 Columns = 7

MD5 checksum = b387bfcf9c123fad59e9069f41a96a55

Variables:

year = year

agwi = aboveground woody increment (megagramPerHectarePerYear)

agwb = aboveground woody biomass (megagramPerHectarePerYear)

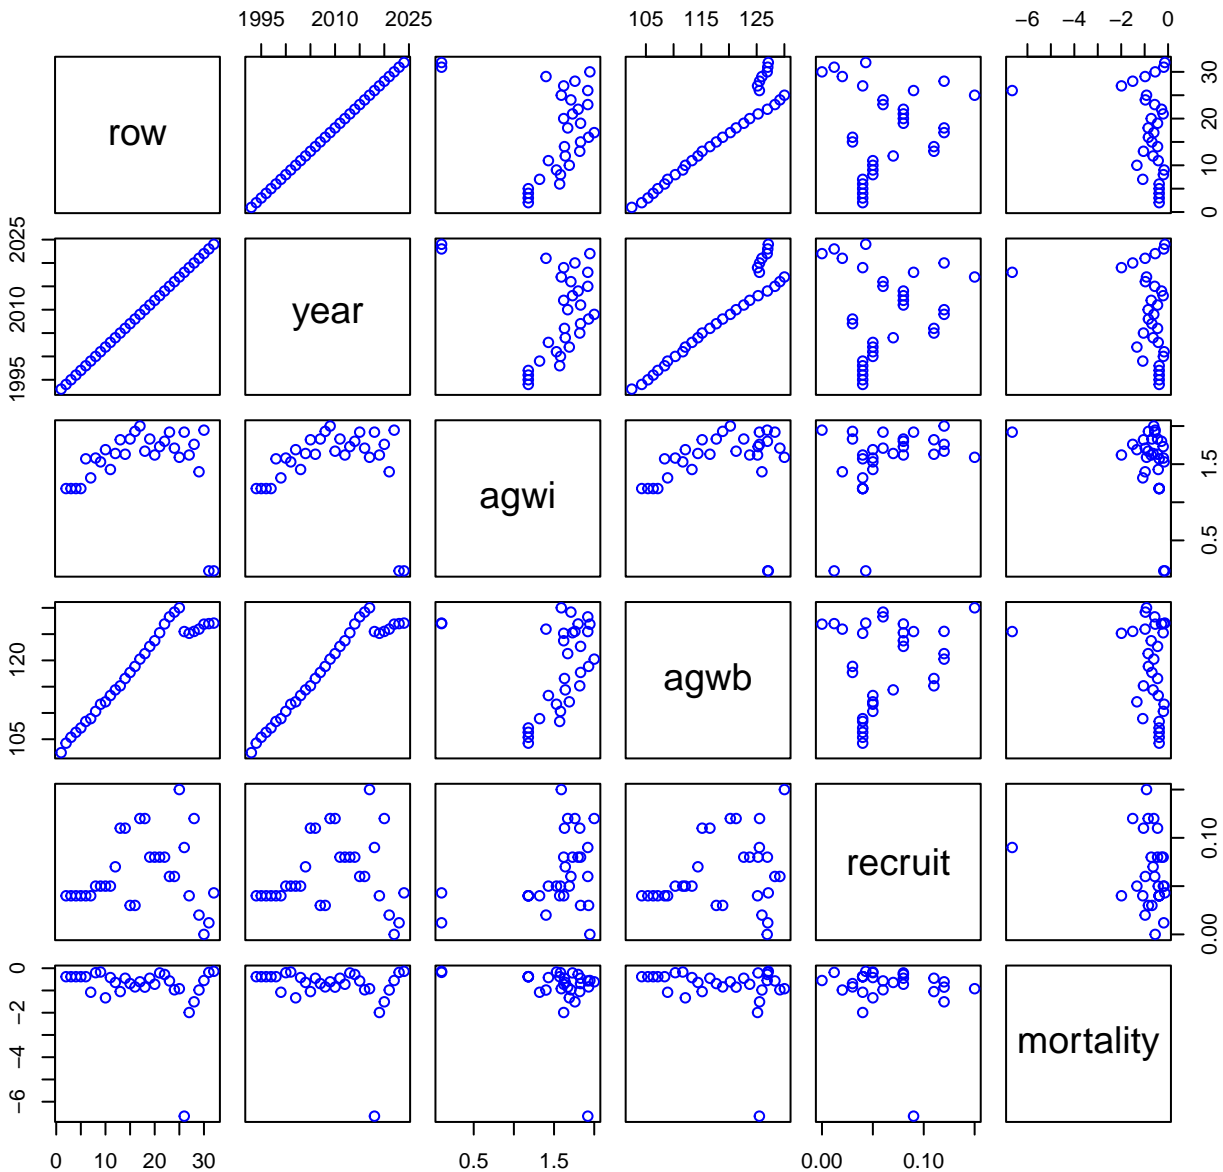

recruit = biomass gained through recruitment  
(megagramPerHectarePerYear)

mortality = biomass lost to mortality (megagramPerHectarePerYear)

anpp = net primary production. calculated as the sum of the  
increment of surviving trees (AGWI) + the sum of the increment of ingrowth +  
the sum of fine litterfall using the methods described in Clark et  
al. 2001. (megagramPerHectarePerYear)

Variable	Min	Median	Mean	Max	NAs
year	1993.000	2008.500	2008.500	2024.000	0
agwi	0.100	1.630	1.529	2.000	1
agwb	102.450	119.550	118.240	130.010	0
recruit	0.000	0.050	0.063	0.150	1
mortality	-6.650	-0.570	-0.850	-0.139	1
anpp	3.020	3.440	3.440	3.820	16
