

Harvard Forest Data Archive HF069-13

Data File:

Name = hf069-13-annual-summ.csv

Description = annual summary

Rows = 39 Columns = 7

MD5 checksum = 5586e2edd6e66271565e2323d2db73b4

Variables:

year = year

agwi = aboveground woody increment (megagramPerHectarePerYear)

agwb = aboveground woody biomass (megagramPerHectarePerYear)

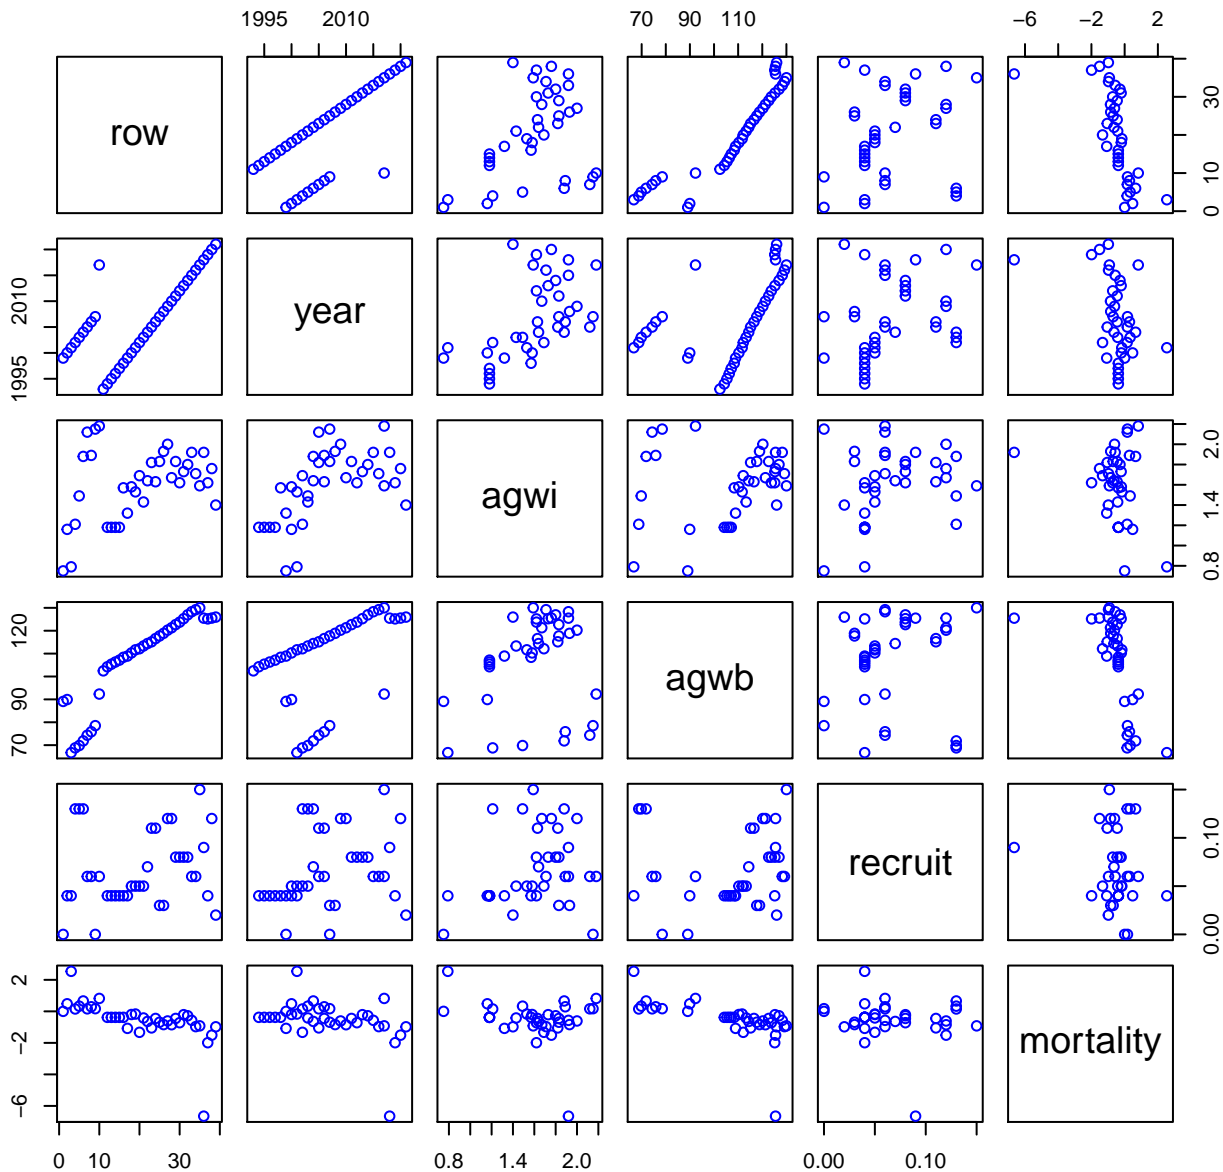

recruit = biomass gained through recruitment
(megagramPerHectarePerYear)

mortality = biomass lost to mortality (megagramPerHectarePerYear)

annp = net primary production. calculated as the sum of the
increment of surviving trees (AGWI) + the sum of the increment of ingrowth +
the sum of fine litterfall using the methods described in Clark et
al. 2001. (megagramPerHectarePerYear)

Variable	Min	Median	Mean	Max	NAs
year	1993.000	2005.000	2006.333	2021.000	0
agwi	0.750	1.635	1.602	2.180	1
agwb	66.730	112.120	107.178	130.010	0
recruit	0.000	0.060	0.067	0.150	1
mortality	-6.650	-0.400	-0.523	2.540	1
annp	3.020	3.440	3.440	3.820	23
