

Harvard Forest Data Archive HF069-13

Data File:

Name = hf069-13-annual-summ.csv

Description = annual summary

Rows = 37 Columns = 7

MD5 checksum = fc86fc555bb467c0fafe8d1b41329839

Variables:

year = year

agwi = aboveground woody increment (megagramPerHectarePerYear)

agwb = aboveground woody biomass (megagramPerHectarePerYear)

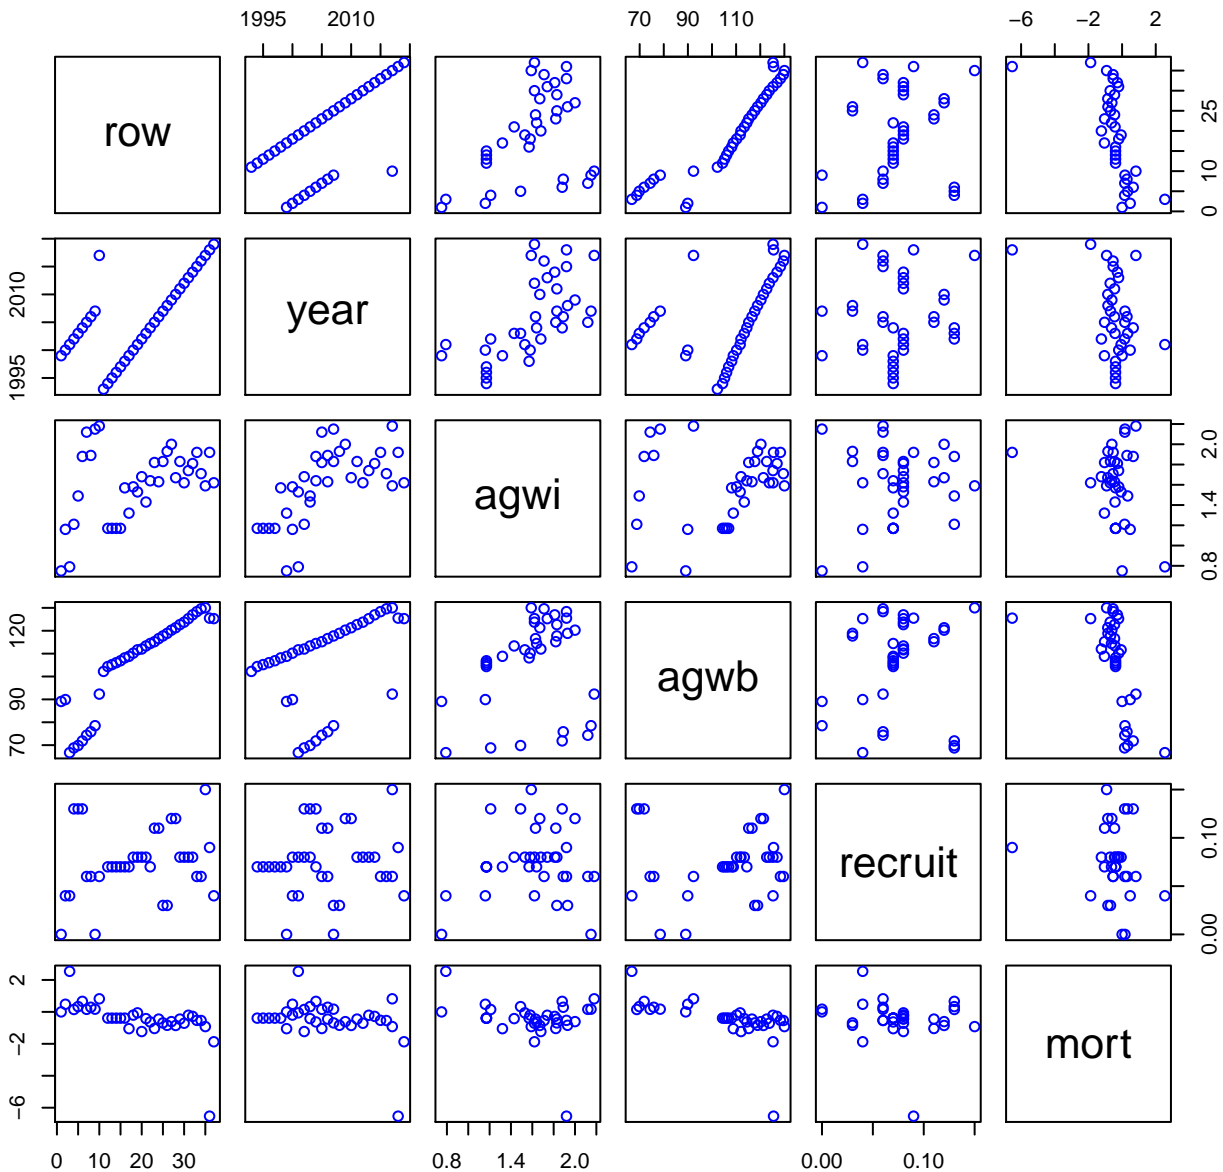

recruit = biomass gained through recruitment
(megagramPerHectarePerYear)

mort = biomass lost to mortality (megagramPerHectarePerYear)

anpp = net primary production. calculated as the sum of the
increment of surviving trees (AGWI) + the sum of the increment of ingrowth +
the sum of fine litterfall using the methods described in Clark et
al. 2001. (megagramPerHectarePerYear)

Variable	Min	Median	Mean	Max	NAs
year	1993.000	2005.000	2005.568	2019.000	0
agwi	0.750	1.635	1.603	2.180	1
agwb	66.730	111.670	106.169	130.030	0
recruit	0.000	0.070	0.075	0.150	1
mort	-6.530	-0.390	-0.457	2.540	1
anpp	3.050	3.445	3.447	3.820	21
