Harvard Forest Data Archive HF246-04

Data File:

Name = hf246-04-regress-cb.csv
Description = regression of abundance vs. cb index
Rows = 8  Columns = 8
MD5 checksum = b1a54271daca70eb4bf620c05a5852a7

Variables:

cb.index = estimated average salamanders count per ACO / transect
           (number)
cb.density = relative density/ m2 computed based on average CB-index
            (i.e. 0.25 m2)
multiplied by 4 (numberPerMeterSquared)
nos.index = relative density of salamanders based on natural objects
           search in
           30×1m-strip transects. Counts of salamanders per each transect was divided by the area of the
           transect (30 m2) to estimate this index. (number)
pop.size = population size of salamanders per each transect as estimated by depletion
method (number)
density = estimated salamanders density based on the estimates of actual population
size/transect. It is population size per transect divided by the area of the transect
(30m2). (number)
